CSE - Repaired practice edition - Answer key

Division C | Rocks And Minerals | Repair appendix

This appendix contains authored replacements and supplied written alternatives. It does not reconstruct unpublished historical material. For the listed item IDs, use this appendix instead of the archived wording and key.

ANSWER KEY - Review only after submitting.

9. (2 points) Authored replacement for source item 9: The repair supplies three specimens: quartz (piezoelectric), galena (not piezoelectric), and stibnite (not piezoelectric). Which specimen can generate electric polarization under suitable mechanical stress?

answer: Quartz. The relevant property is piezoelectricity; do not use the inconsistent B/C pair in the source key. (2 points).

34. (2 points) Authored replacement for source item 34: A clean elemental sulfur specimen is odorless at room temperature. Explain why a rotten-egg odor would not, by itself, identify that specimen as sulfur.

answer: Rotten-egg odor is associated with hydrogen sulfide, a different substance. Do not equate a compound containing sulfur with pure elemental sulfur or use smell/taste as a definitive sample identification. (2 points).

63. (2 points) Authored replacement for source item 63: A volcanic neck consists of magma solidified inside a volcanic conduit and exposed later by erosion. Is the solidified conduit an intrusive or extrusive body?

answer: Intrusive (hypabyssal/shallow intrusive); it solidified inside the conduit rather than as a surface lava flow. (2 points).
